Innovation

Due to legal restraints, your own environmental awareness or the customers demands the use of waterbased coatings becomes more and more important. At the same time the user does not want to miss the flexibility regarding delivery time, ordered quantity and colour match as well as to lower his standard in quality compared to solvent based products.

The newly developed waterbased multi-paint-system **Pro Mix® AQUA** meets these demands and creates with many different qualities not only economical advantages.

A

AQUA

Flexibility

Pro Mix® AQUA is based on only a few pigment pastes to cover the complete colour spectrum of solid colours. All colours can be produced with and without lead containing pigments. Due to additional aluminium pastes it is even possible to produce simple effect colour shades. The addition of the pigment pastes to many different waterbased qualities provides exact colours and durable coatings as required.

A transparent base defines the particular waterbased quality of the product. So all common industrial primers and top coat qualities, single or two component, with different gloss levels and structures are made available.

As the tinting takes place by adding the pigment pastes in ready prefilled cans the packaging costs are reduced to a minimum. Because of the different can sizes even smaller amounts can be tinted in line with the requirements.

The tinting can not only be carried out manually, but as well with an automatic dispenser, whereas the formulation is optimized in quality, covering power, price and stability.

AQUA

Success

Using the multi-paint-system Pro Mix® AQUA offers the possibility to supply a very wide range of customers with waterbased coatings, still meeting all demands on flexibility without additional costs.

Minimum delivery times without a big backup stock and highest quality without solvents assure the success for the future.
